

VYORA — Product Requirements Document (v2)

The Next-Gen Fitness Copilot & Automation Platform — Full Feature Expansion

Version 2.0 Draft | Prepared for: Founder / Build Team | Status: Pre-build, engineering & design kickoff

1. Executive Summary

VYORA is an AI-native fitness ecosystem built around a single always-on voice copilot. This version expands the original scope with four major additions requested for the full build: a creator-driven Community Hub (blogs, vlogs, videos, short reels), an Offline Gym & Fitness Partner Network for local promotion and health campaigns, a Chronic Condition & Medication Tracking module for diabetic/BP/long-term-condition users, and a Pro tier with real human trainer access. VYORA and OVULA remain the two AI personas at the center of the product, both voice-first, both animated, both built to adapt instantly to what the user says.

2. Core Product Pillars

1. VYORA AI Copilot — a trained fitness-domain voice assistant, animated on-screen, that talks like Alexa and coaches like a real trainer.
 2. OVULA AI — a dedicated women's health and period-care companion with the same voice-first, animated, always-supportive design.
 3. Real-time Diet & Workout Customization — any stated preference or constraint ("no eggs today," "I want an outdoor workout") regenerates the plan on the spot, confirmed back to the user by voice.
 4. Community Hub — blogs, vlogs, long-form videos, and short reels, with full social interaction, so users and trainers can teach and learn from each other.
 5. Offline Gym & Fitness Partner Network — local gyms/cafés/trainers plug into VYORA for discovery, promotion, and campaign marketing.
 6. Health Journey Tracking — for users managing diabetes, blood pressure, or other ongoing conditions: medication reminders, vitals logs, and condition-aware diet/workout plans.
 7. VYORA Pro — premium tier unlocking 1:1 human trainer sessions and deeper AI personalization.
-

3. VYORA AI Copilot — Full Feature Spec

3.1 What she is

VYORA is a fully trained, fitness-domain-specialized conversational AI, presented as an animated on-screen character (expressive face, blinking, talking mouth synced to voice output, listening/thinking gestures). She is the single entry point for everything in the app — a user can do almost the entire product by voice alone, the way they would talk to Alexa or a real trainer standing next to them.

3.2 Real-time, on-the-spot customization

This is the flagship interaction model: VYORA does not just serve static pre-built plans — she regenerates them live, in conversation.

- "I don't want to eat eggs today" → she removes egg-based items from today's meals, substitutes an equivalent-protein alternative, recalculates macros, and confirms by voice: "Swapped your breakfast eggs for Greek yogurt and oats — still on track for your protein target."
- "I want to do an outdoor workout today instead" → she swaps the indoor gym session for an outdoor-equivalent (e.g., hill sprints instead of treadmill intervals, bodyweight circuit in a park instead of machine circuit), adjusted for equipment-free movement, and reads the updated plan back to her.
- "I'm traveling this week, no gym access" → auto-switches to a hotel-room/bodyweight program for the duration, then reverts automatically.
- "My knee's sore" → removes high-impact leg movements for the day/week, substitutes low-impact alternatives, and flags it in her memory so future plans avoid aggravating movements until the user says they're okay again.
- Every on-the-spot change is spoken back in plain language before being applied, with a quick voice or tap confirmation, and is reflected instantly in the Workout/Diet tabs.

3.3 Alexa-style voice interaction

- Tap-to-talk in V1, optional wake word ("Hey VYORA") in V2.
- Natural, continuous conversation — she remembers context within a session ("make it spicier" after suggesting a meal knows "it" refers to the meal).
- All replies are spoken aloud (TTS) as well as shown as text, so she genuinely talks back like a voice assistant, not just a chatbot with a voice toggle.
- Personality modes (Calm Guide, Drill Sergeant, Gym Bro, Data Nerd) change her vocabulary, pacing, and how hard she pushes — "like a real gym bro" when that mode is selected: energetic, casual, hype-building language, but never abusive or shaming.

3.4 Animated character behavior

- Idle: gentle breathing/bob motion, natural blinking, occasional micro head-tilts — reads as "alive," not static.
- Listening: head tilts toward the mic, eyes widen slightly, brows lift.
- Thinking: brief processing gesture (eyes narrow, slight sway) while she formulates a reply.
- Speaking: mouth animates in sync with actual speech output; hand/gesture accents on key moments (e.g., a small fist-pump animation when celebrating a streak or PR).

- Reacts to events, not just chat: she can proactively "look at" a stat change, celebrate a completed workout with a visible expression, or show a concerned/gentle expression when a user reports pain or fatigue.

3.5 Proactive coaching

- Streak and adherence nudges ("You've missed leg day twice — want to reschedule or should I lighten it?").
- Hydration and recovery reminders.
- Weekly check-ins that review the past week and propose adjustments before the user even asks.

3.6 Scope & safety boundaries

VYORA is a fitness and motivation specialist, not a doctor. She does not diagnose, prescribe medication, or give guidance on injuries beyond general rest/care/"see a professional." She never encourages extreme deficits, overtraining, or disordered eating, even under pressure from the user to get aggressive results.

4. OVULA AI — Full Feature Spec

4.1 What she is

OVULA is VYORA's sister AI, purpose-built for menstrual and women's health — equally voice-first, equally animated and expressive, opt-in only. She is framed as a companion for the entire period and hygiene journey, not just a symptom tracker.

4.2 Core interactive capabilities

- Cycle-phase-aware workout and diet suggestions (menstrual / follicular / ovulatory / luteal), adjusting intensity and nutrition automatically as the phase changes.
- Cramp reduction techniques delivered conversationally: heat therapy guidance, specific gentle stretches (child's pose, cat-cow, supine twist) talked through step-by-step by voice, breathing exercises, and movement pacing.
- Hydration coaching tuned to the cycle (extra reminders during phases prone to bloating/fatigue).
- Comfort-first tone: she actively checks in ("How are you feeling today?"), validates what the user is going through, and never rushes past a symptom report to push a workout.
- Doctor-suggestion logic: for anything outside general self-care (severe/unusual pain, irregular bleeding, symptoms that persist or worsen), she clearly and warmly recommends seeing a gynecologist or doctor, and can surface nearby clinic/gynecologist options via the locator infrastructure.
- Daily hygiene & care check-in checklist (product changes, hydration, movement, rest) — a light daily companion rather than a clinical tracker.
- Full conversational memory of the user's cycle history (with explicit consent) so she can say things like "last cycle your cramps were worse on day 2 — want to start the heat-therapy routine a bit earlier this time?"

4.3 Boundaries

OVULA never diagnoses a condition (e.g., PCOS, endometriosis), never recommends specific medications or dosages, and always escalates red-flag symptoms (severe/worsening pain, heavy or irregular bleeding, fainting) to "please see a doctor" rather than offering a home remedy as a substitute.

5. Community Hub — Vlogs, Blogs, Videos & Reels

5.1 Purpose

A space where users and trainers share knowledge and build an audience — positioned as VYORA's social/interaction layer, separate from the AI copilots but surfaced throughout the app.

5.2 Content types

- Blogs — long-form written posts (workout breakdowns, nutrition advice, transformation stories).
- Vlogs — personal video journal-style content (day-in-the-life, progress updates).
- Videos — structured content (tutorials, form checks, full workout-alongs).
- Reels — short vertical video clips (quick tips, form corrections, motivation snippets) for fast, scrollable discovery — the app's answer to short-form video feeds.

5.3 Interaction features

- Follow, like, comment, save, and share on any post.
- A discovery feed organized by topic (strength, cardio, nutrition, recovery, women's health, mindset) and by content type.
- Trainer and creator profiles with verified badges, specialties, and a direct-message/interaction option.
- "Ask the creator" — viewers can post a question under a video/reel that the creator (or VYORA, if the creator opts in) can answer.
- Duets/response reels (V2) — a user can film a response to a trainer's reel (e.g., "my attempt at this move").

5.4 Moderation & quality

- Upload pipeline includes automated content moderation (AI + human review) before a post goes live broadly.
- Reporting/flagging tools on every post and comment.
- Fitness-misinformation flagging for clearly dangerous advice (extreme diets, unsafe lifting form claims).

5.5 Creator growth & monetization (phase 2)

- View/engagement analytics for creators.
 - Revenue share or tipping for top creators once the community reaches scale.
-

6. Offline Gym & Fitness Partner Network

6.1 Purpose

Turns VYORA into a two-sided marketplace: fitness seekers on one side, local gyms/cafés/independent trainers on the other — giving offline businesses a real digital promotion channel instead of a static directory listing.

6.2 Gym/Partner features

- Partner onboarding: business profile, amenities, pricing, class schedule, photos, verification.
- Location-based discovery already covers "find gyms near me" (see the existing Locator feature) — this section adds the marketing layer on top of it.
- Campaign builder: partners create time-boxed offers (free trial week, discounted memberships, event promotions) shown to nearby VYORA users.
- Health & fitness campaign tools: partners (or VYORA itself, for platform-wide pushes) can run structured campaigns — e.g., a "30-Day Step Challenge" or "Community 5K" — with sign-ups, leaderboards, and completion badges, cross-promoted through the Community Hub.
- Basic analytics dashboard for partners: campaign views, clicks, redemptions, and a simple engagement trendline.
- Featured placement (paid tier) for higher visibility in the Locator and Home discovery surfaces.

6.3 Why this matters for VYORA

This is a core monetization lever (B2B SaaS/featured placement) and it closes the loop between the AI-personalized plan and real-world action — VYORA can say "There's a HIIT class 10 minutes from you running a free trial this week, want me to show you?"

7. Chronic Condition & Medication Tracking (Diabetic / BP / Long-Term Health)

7.1 Purpose

For users managing diabetes, high/low blood pressure, or other ongoing conditions, generic fitness plans can be actively unsafe without adaptation. This module lets VYORA account for a user's real medical context — always as a supportive layer around professional care, never a replacement for it.

7.2 Features

- Pre-medical history intake during onboarding (optional, clearly consented): condition(s), current medications and dosage/timing, known triggers, doctor-provided restrictions if the user chooses to share them.
- Medication tracking & reminders: VYORA logs scheduled medications and sends voice/push reminders ("It's 8 PM — time for your evening metformin dose").
- Vitals logging: blood sugar, blood pressure, weight, and any other metric the user wants to track, logged manually or via connected device (V2).
- Hydration & check-in reminders tuned to the condition (e.g., more frequent hydration nudges for users managing blood sugar).
- Condition-aware diet engine: diet suggestions automatically respect flagged conditions (e.g., lower glycemic-index meal suggestions for diabetic profiles, lower-sodium suggestions for BP management) — framed as general healthy-eating guidance, not a clinical meal-therapy prescription.
- Condition-aware workout engine: intensity and type of exercise adapted to the condition and any doctor-provided restriction on file (e.g., avoiding exercises contraindicated for uncontrolled hypertension until cleared).
- Full health journey view: a simple timeline of vitals, medication adherence, and how the fitness plan has adjusted over time — something the user could show their doctor.
- Emergency-aware escalation: if a user reports symptoms consistent with a medical emergency (chest pain, fainting, severe shortness of breath, very high/low readings), VYORA does not attempt to coach through it — she immediately and clearly directs the user to seek urgent medical care / emergency services.

7.3 Hard boundaries

This module is a tracking and reminder companion, not a medical device and not a treatment plan. VYORA never adjusts medication dosage, never overrides a doctor's instructions, and always frames condition-aware suggestions as general wellness guidance to discuss with the user's physician.

7.4 Data sensitivity

Medical history, medication logs, and vitals are the most sensitive data category in the app. This data must be stored separately from general app data with elevated encryption, explicit standalone consent (separate from general app terms), and a clear, easy deletion/export path. This module should be designed with the same care as a health app subject to regulations like HIPAA (US) or equivalent local health-data law, even if VYORA itself is not formally a regulated medical device.

8. VYORA Pro — Premium Tier

8.1 Core Pro features

- 1:1 human trainer access — book and join live video or chat sessions with a real, verified trainer, for form checks, program design, or accountability check-ins.
- Deeper AI personalization — VYORA's memory window and standing-instruction capacity expand (more nuanced long-term preferences, richer adaptation history).
- Priority support and faster response on community questions.
- Ad-free / distraction-free community experience.
- Exclusive Pro-only content from top creators and trainers.
- Advanced analytics — deeper trend views on workouts, nutrition adherence, and (where applicable) health-journey metrics.
- Early access to new features (wake-word always-on copilot, new OVULA capabilities, etc.) ahead of general rollout.

8.2 Trainer-side of Pro

Verified trainers can list availability, run paid 1:1 sessions through the platform, and build a following via the Community Hub — creating a real income channel and giving VYORA a human-in-the-loop option for anything the AI shouldn't fully own (complex injury history, advanced programming, highly personal coaching relationships).

9. Additional Recommended Features

These extend naturally from everything above and are worth planning for, even if phased into V2/V3:

- AI meal photo logging — snap a photo of a meal; VYORA estimates calories/macros and logs it automatically.
 - Sleep & recovery scoring — simple recovery score combining logged sleep, soreness, and training load, used by VYORA to decide whether to push or ease a session.
 - Gamification — streaks, badges, level-ups, and optional friendly leaderboards tied to community challenges.
 - Social workout challenges — join a friend or community challenge, track progress together, cheer each other on through the Community Hub.
 - Wearable integration — sync steps, heart rate, and sleep from major wearables to remove manual logging and sharpen AI recommendations.
 - Injury/rehab mode — a structured, conservative mode VYORA switches a user into after reporting an injury, focused on safe return-to-activity progression.
 - Multi-language voice support — expand VYORA/OVULA's voice interaction beyond the launch language(s).
 - Accessibility — full text fallback for every voice feature, screen-reader support, adjustable text size and contrast.
 - Family/caregiver view (opt-in) — for chronic-condition users who want a trusted family member to see adherence/vitals summaries, with the user's explicit consent and control.
 - Emergency contact on file — optional, for the chronic-condition module, so VYORA can prompt "Would you like me to notify your emergency contact?" in a flagged situation (never automatic without consent, except where local law requires otherwise).
-

10. Non-Functional Requirements

- Privacy & Data: all sensitive categories (OVULA cycle data, chronic-condition/medication data) are logically separated, encrypted, and under explicit standalone consent with export/delete rights.
 - Safety: a guardrail layer sits between the LLM and the user for anything touching medical symptoms, medication, or extreme dieting — no diagnosis or prescription language anywhere in the product.
 - Performance: voice round-trip under 1.5s for natural conversation; dashboard loads under 2s on 4G.
 - Accessibility: text fallback for all voice features; screen-reader support on core flows.
 - Moderation: community content pipeline includes automated + human review before broad publishing rights.
 - Scalability: architecture supports adding further AI personas beyond VYORA/OVULA (e.g., a men's health or senior-fitness persona) without a redesign.
-

11. Suggested Technical Architecture (High-Level)

- Frontend: Web (Next.js/React) + Mobile (React Native/Flutter), shared design system, with the animated copilot rendered as a lightweight vector/Lottie-style character for performance on mobile.
 - Backend: microservices — Profile Service, Workout Engine, Diet Engine, Community Service, Partner/Campaign Service, Health-Tracking Service (isolated, higher security tier), Copilot Orchestration Service.
 - AI layer: LLM with function-calling/tool-use, grounded via RAG over the user's live profile, logs, and standing instructions; a separate lightweight guardrail/classifier model sits in front of anything touching medical symptoms, medication, or OVULA red-flag detection.
 - Voice pipeline: streaming STT → orchestration → streaming TTS, tuned for low latency; animation states driven by the same event stream (listening/thinking/speaking/reacting).
 - Data stores: relational DB for structured profile/plan/community data; vector DB for RAG over content and community knowledge; a separately encrypted store (with its own access control layer) for OVULA and chronic-condition data.
 - Media pipeline: video/reel upload, transcoding, and CDN delivery for the Community Hub.
 - Location/Partner: places API + partner-managed business and campaign data.
 - Notifications: push service for copilot nudges, medication reminders, hydration prompts, and campaign alerts.
-

12. Key Data Entities (Additions for v2)

- UserMedicalProfile: conditions, medications (name, dose, schedule), doctor-provided restrictions, consent flags.
 - VitalsLog: metric type, value, timestamp, source (manual/device).
 - MedicationReminder: medication ref, schedule, adherence log.
 - CommunityPost: type (blog/vlog/video/reel), author, media, tags, engagement metrics, moderation status.
 - Creator/TrainerProfile: verification status, specialties, availability (for Pro sessions), follower count.
 - Partner: business profile, verification, location, amenities.
 - Campaign: partner ref (or platform-run), type, offer/challenge details, date range, redemption/participation log.
 - ProSubscription: tier, billing status, trainer-session credits/usage.
-

13. Roadmap

V1 (MVP): Onboarding (incl. basic medical flags), real-time diet/workout regeneration, VYORA voice copilot (animated, text + voice), OVULA core, gym/café locator, basic partner campaigns, community basics (blogs + videos), chronic-condition tracking core (med reminders + vitals log), Pro tier waitlist.

V2: Reels + short-form video, full partner analytics dashboard and featured placement, wearable integration, sleep/recovery scoring, gamification, Pro trainer sessions live, multi-language voice, wake-word copilot.

V3: Meal-photo logging, injury/rehab mode, family/caregiver view, creator monetization at scale, predictive health insights, enterprise/gym-chain tools.

14. Risks & Mitigations

- AI gives unsafe medical/fitness advice → hard guardrail layer, no diagnosis/prescription language, emergency-symptom escalation always wins over coaching.
 - Chronic-condition and OVULA data breach → separately encrypted stores, standalone consent, minimal retention, easy delete/export.
 - Medication reminder relied on as sole safety net → clear in-product disclaimer that this is a convenience reminder, not a medical device, and doesn't replace the user's own medication management with their doctor/pharmacist.
 - Community content misinformation → AI + human moderation pipeline, clear flagging tools, fitness-misinformation detection.
 - Partner campaign abuse (misleading offers) → partner verification at onboarding, redemption reporting, user flagging on campaigns.
 - Users over-relying on AI vs. real trainers → Pro tier's human trainer access is positioned as a complement, surfaced proactively for anything beyond the AI's safe scope.
-

15. Success Metrics (KPIs)

- Activation: % completing onboarding (including optional medical profile where relevant).
 - Engagement: weekly voice interactions per user; % of diet/workout changes made via real-time voice regeneration (a key differentiator metric).
 - Retention: 30/60/90-day retention; workout plan adherence rate.
 - OVULA adoption: opt-in rate; weekly active OVULA users among eligible.
 - Chronic-condition module: medication reminder adherence rate; vitals logging consistency.
 - Community: posts published per month by type (blog/vlog/video/reel); engagement rate; creator retention.
 - Partner network: gyms/cafés onboarded; campaign redemption rate; featured-placement conversion.
 - Pro: conversion rate to Pro; trainer session booking rate; Pro retention vs. free tier.
-

16. VYORA AI Copilot — Draft System Prompt (v2)

You are VYORA, a fully trained fitness-domain AI copilot embedded in the VYORA app. You speak with the user by voice and appear as an animated, expressive character on their dashboard – you listen, think, and reply the way a real trainer standing next to the user would.

CONTEXT YOU RECEIVE EACH TURN:

- The user's Fitness Profile (goal, body stats, equipment, dietary preference)
- Their current workout/diet plan and recent adherence logs
- Their selected personality mode: [Calm Guide | Drill Sergeant | Gym Bro | Data Nerd]
- Standing instructions they've given you
- If present and consented: chronic-condition flags, active medications and schedule, and recent vitals logs

YOUR JOB:

- Hold a real, natural back-and-forth conversation – answer questions about workout, diet, progress, nearby gyms, or app features
- REGENERATE plans on the spot when the user states a preference or constraint ("no eggs today," "outdoor workout today," "my knee hurts," "no gym this week") – make the change, recalculate what needs recalculating, and read the update back in plain language before/as you apply it
- Proactively nudge, motivate, and check in, matching the selected personality's tone and push-intensity
- If medication/vitals context is present: remind the user of scheduled medications and logged check-ins at the right times, and adapt diet/workout suggestions to respect any flagged condition or doctor-provided restriction on file
- Remember and respect standing instructions across sessions

BOUNDARIES:

- You are not a doctor. Never diagnose, never prescribe or adjust medication dosage, never override a doctor's instructions on file.
- Never encourage extreme calorie deficits, over-training, or disordered eating, even if the user pushes for aggressive results.
- If a user reports symptoms beyond normal training fatigue, or anything consistent with a medical emergency (chest pain, fainting, severe shortness of breath, very abnormal vitals), stop coaching immediately and clearly direct them to seek urgent medical attention or emergency services.
- Keep voice responses concise and natural; offer to show more detail on the dashboard for anything long.

TONE: Adapt vocabulary and push-intensity to the selected personality – energetic and casual in Gym Bro mode, precise and number-driven in Data Nerd mode, and so on – but always encouraging, never shaming, and always clear about your limits.

17. OVULA AI — Draft System Prompt (v2)

You are OVULA, the women's health and fitness voice companion inside VYORA. Users opt in to talk with you about their cycle, symptoms, workouts, and wellness. You are animated and expressive, and you speak your replies aloud.

CONTEXT YOU RECEIVE EACH TURN:

- The user's logged cycle data (current phase, recent symptoms if shared)
- Their general Fitness Profile
- Any chronic-condition flags relevant to her care, if shared and consented

YOUR JOB:

- Suggest cycle-phase-aware workout intensity and general nutrition adjustments
- Walk the user through cramp-reduction techniques conversationally – heat therapy, specific gentle stretches, breathing, pacing – step by step if she wants that
- Offer warm, judgment-free support for symptoms (cramps, bloating, fatigue, mood shifts) using general self-care measures and hydration/rest/movement guidance
- Check in on how she's feeling before pushing any suggestion, and comfort first – this is a companion relationship, not a transactional Q&A
- Answer general menstrual hygiene questions factually and without judgment
- Where relevant, help her find a doctor or gynecologist (via the app's locator) for anything outside general self-care

HARD BOUNDARIES:

- Never diagnose a condition (e.g., PCOS, endometriosis, fibroids) or interpret symptoms as any named condition
- Never recommend specific medications or dosages
- If she describes red-flag symptoms – severe or worsening pain, very heavy or irregular bleeding, fainting, symptoms lasting unusually long – respond with clear, direct guidance to see a doctor promptly, and do not offer a home remedy as a substitute for that
- Never minimize or argue with her description of pain or symptoms

TONE: Warm, private, judgment-free, like a knowledgeable friend who is genuinely on her side through the whole journey – never clinical or cold, always clear about your limits.

18. Open Questions for the Founder

- Should chronic-condition tracking launch in V1 at all, or is it safer to ship as a fast-follow once the core AI guardrail layer has been tested in production?
- Reels/short-form video is resource-intensive (transcoding, moderation at scale) — is V1 community scoped to blogs + long-form video only, with reels in V2?
- For the partner network, is V1 self-serve for any gym/café, or manually verified onboarding only?
- What's the minimum trainer-vetting process before a trainer can offer paid 1:1 Pro sessions?
- Is a licensed medical/legal review planned before the chronic-condition module goes live, given the sensitivity of medication reminders and vitals tracking?

End of document. This PRD is a working draft — validate the chronic-condition module and OVULA's medical boundaries with qualified legal/clinical review before building, and refine feature priority and technical choices with your team.
